RUSH sequence search request for 09/211691

Hello Christina,

Please authorize the request below as RUSH. The reason being, this is an RCE and applicants have now included the following sequences in their claims.

Many Thanks -Manjunath

Manjunath N. Rao

Please search the following as soon as possible for application with serial number **09/211691** 

1. SEQ ID NO: 5 and 6 against all <u>commercial nucleic acid sequence databases</u>, <u>issued</u>

<u>patents/published applications nucleic acid sequence database</u> and <u>pending</u>

<u>application nucleic acid sequence database</u>. Please provide a <u>print</u> of <u>results</u>

If you have any questions please call me at the above phone number.

**Thanks**

/gene="NNA1040"
/gene="NNA1040, possible type I restriction-modification
/note="NNA1040, possible type I restriction-modification
system specificity protein, pseudogene, len: 1217 bp;
N-terminus shows weak similarity to the C-terminal half of
TR:050359 (EMBL:L25415), hsdS1B, Mycoplasma pulmonis
restriction-modification enzyme subunit S1B (336 aa),
fasta scores; E(): 2.3e-06, 26.2% identity in 141 aa
overlap and to many hypothetical restriction-modification
subunits. Also similar to NNA1041, fasta scores; E():
4.8e-10, 37.0% identity in 100 aa overlap. C-terminus
similar to part of SW:TIS1_ECOLI (EMBL:XI3145), hsdS,
Escherichia coli type I restriction enzyme EcoR124II
specificity protein (410 aa), fasta scores; E(): 1.9e-14,
39.6% identity in 182 aa overlap. Similar to NNA1040, E():
2.9e-09, 38.0% identity in 100 aa overlap. Contains Pfam
match to entry PF01420 Methylase S, Type I restriction
modification DNA specificity domain. Contains a G(8) tract
which would allow translation as an intact CDS, if
variable. Lies within a region of unusually low GC

Gilbert M, Young NM, Wakarchuk WW;

A new glycosyltransferase fusion protein useful in the enzymatic synthesis of oligosaccharides.

WPI; 1999-395174/33.

Example 1; Page 40; 63pp; English.

This sequence represents a PCR primer for the Neisseria alpha-2,3-sialyltransferase coding sequence. The invention relates to a nucleic acid encoding a fusion protein that comprises a glycosyltransferase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             catalytic domain and a catalytic domain from an accessory enzyme that is cinvolved in formation of a nucleotide sugar which is a saccharide donor great a glycosyltransferase reaction. The fusion protein is useful in the catalyse more than one reaction involved in the enzymatic synthesis of oligosaccharides. The fusion proteins are able to is useful for the development of therapeutic agents that have specific catalyse more than one reaction involved in the enzymatic synthesis. This cc carbohydrate structures. Carbohydrates are involved in recognition cc synthesis of the surface of cells. The fusion protein can be used for the coverless of both natural carbohydrates and synthetic derivatives with convel properties. The fusion polypeptide allows two glycosyltransferase cc reactions in a single vessel, provides improved yields of end products. Cc reduced. The fusion protein can also use directly different donor canalogues and various acceptors with a terminal galactose residue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

   The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AABS25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc used in the exemplification of the present invention. The nucleic acid cc sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a cc medicament (or in the manufacture of a medicament) for treating, cc example, some of the identified proteins could be components of vaccines cc against Meningococcus B; against all serotypes; and/or against all cc against Meningococcus B; against all serotypes; and/or against all cc against Meningococcus B; against all serotypes; and/or against all cc against meningococcus B; against all serotypes; and/or against all cc against meningococcus B; against all serotypes; and/or against all cc against meningococcus B; against all serotypes; and/or against all cc against meningococcus B; against all serotypes; and/or against all cc against septicitic probes. Attempts to make efficacious Meningococcus B cracines have failed mainly due to antigen tolerance. Multivalent cc vaccines have also been tried but none have successfully overcome creations are not considered an opportunity to identify secreted or surface exposed proteins continued by the presumed targets for the immune system and which are not considered to antigenically variable or at least more conserved than other more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes the full length genome of Neisseria CC meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 CC represent fragments of the NMB genomic sequence, as the sequence was too CC long to go in a record on its own it was split into B sequence which CC overlap each other at the beginning and end of each sequence by 49980 bp CC (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of CC AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of CC AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins CC grimers which are used in the exemplification of the present invention. CC The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins CC be used in vaccines which binds to the proteins can be used in compositions CC diagnostic reagent for detecting the presence of Neisserial bacteria or CC diagnostic reagent for detecting the presence of Neisserial bacteria or CC of antibodies raised to Neisserial bacteria.
                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                              26-JUN-2001
                                                                                                                                                                                                                                                                                                                                                                                                  AAH07120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encodes an alpha-2,3-siallyltransferase which has been isolated from Neisseria meningitidis. The protein can be used as a reagent for adding a sialic acid residue to an acceptor having a terminal galactose residue, e.g. in synthesis of biologically active oligosaccharides or sialyl-modified proteins or lipids. The nucleic acid sequence can be used for the recombinant production of alpha-2,3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 199

```
CC nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination (c) of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination (c) of an oligonucleotide comprising a sequence complementary to the comprises at least 15 nucleotide which comprises a 5'-end (c) sequence and an oligonucleotide comprising a sequence complementary to a coligonucleotide which comprises a 1'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of complementary to a coligonucleotide comprises at least 15 nucleotides and the combination of complementary. The primer sets can be used in antisense therapy and in the complementary to a coligonucleotide comprises are useful for synthesising polynucleotides, complementary to a coligonucleotide comprises are useful for synthesising polynucleotides, complementary and in the complementary and in the complementary and in complementary to a complementary to a complementary to a complementary and in the selected from those defined in the complementary and in the complementary to a comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ota T,

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL016176) and the encoded proteins (ABL01737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP68949) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (Parkinson's or Alzheimer's diseases), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-MAR-2001; 2001US-00799451

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polynucleotide. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of the arginine-rich protein-like polypeptides, such as mapping, identification of mutations responsible for genetic disorders, and in assessing bloddyersity. The present sequence represents a novel

The present invention describes an isolated tumour-associated antigenic CC trarget (TAT) nucleic acid comprising: (a) any of 4622 nucleotide CC sequences (see SEQ ID No:1 to 4622); (b) the full-length coding region of CC (a); (c) the complement of (a) or (b); (d) a sequence that has 80% CC (c). Also described: (l) an expression vector comprising the above (c) nucleic acid; (2) a host cell comprising the above expression vector; (3) CC a process for producing a polypeptide; (4) an isolated polypeptide CC nucleotide sequences; (b) an amino acid sequence encoded by any of the above CC nucleotide sequences; (b) an amino acid sequence encoded by the full-CC length coding region of the above nucleotide sequences; or (c) a sequence (c) at least 80% identical to (a) or (b); (5) a chimeric polypeptide; (6) CC comprising the above polypeptide fused to a heterologous polypeptide; (6) a soluted antibody that binds to the above polypeptide; (7) a process for producing the antibody; (8) an isolated oligopeptide that binds to the above polypeptide (7AT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the

The TAT sequences have cytostatic activities, and can be used in gene therapy. The composition and methods are useful for diagnosing, preventing or treating cancer. The composition is also used for preparing a medicament for the therapeutic treatment or diagnostic detection of a cell proliferative disorder or cancer. The present sequence represents a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Parkinson's disease, Altheimer's disease), muscular disorders (e.g. myotonic dystrophy, catatonia), endocrine disorders (e.g. diabetes, Carave's disease), cancers (e.g. leukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. Goodpasture's syndrome) infections (e.g. viral, fungal, bacterial, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) or hepatic diseases (e.g. cirrhostis). SECP polynucleotides can be used to create humanised animals or transgenic animals to model human disease. The invention is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            molecules encoding such proteins. SECP sequences are useful in diagnosing, preventing and treating disorders associated with an at expression or activity of SECP such as neurodegenerative disorders
                                                                                                                                                            05-NOV-1997;

The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments CC can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for CC diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan CC syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, will be and's disease, tuberous sclerosis, hereditary CC spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary CC syndrome, osteogenesis imperfecta, acute intermittent porphyria, CC syndrome, osteogenesis imperfecta, acute intermittent porphyria, CC system, infection by pathogenic microorganisms, and characteristics such endurance, fertility, and susceptibility or receptivity to particular CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or vy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC AAX10269-X12937 are human DNA fragments which contain biallelic CC polymorphic markers which have been isolated using the primers CC represented in AAX09121-X10268. The base occupying the polymorphic site CC is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments CC can be used in methods for determining polymorphic forms in an individual CC for use in e.g. forensics, patermity testing or for phenotypic typing for CC diseases such as agammagloblinemia, diabetes insipidus, Lesch-Nyhan CC syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary CC spherocytosis, von Willebrand's disease, tuberous selerosis, hereditary CC syndrome, osteogenesis imperfecta, acute intermittent porphyria, CC syndrome, osteogenesis imperfecta, acute intermittent porphyria, CC system, infection by pathogenic microorganisms, and characteristics such CC as longevity, appearance (e.g. baldness, obesity), strength, speed, CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid CC coronbylaxis of such diseases

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-949-016-15676
Sequence 5, Application US/09257584A
Patent No. 6177611
GENERAL INFORMATION:
APPLICANT: Rice, Douglas A.
TITLE OF INVENTION: Constitutive Maize Promoters
FILE REFERENCE: 5718-33, 035718/175218
CURRENT APPLICATION UMMBER: US/09/257,584A
CURRENT FILING DATE: 1999-02-25
EARLIER FILING DATE: 1999-02-26
NUMBER OF SEQ ID NOS: 34
SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US-09-949-016-12968/c
